

Maidencreek Township Authority
Water Systems Identification - PWSID 3060012
Consumer Confidence Report - 2007

ESTE INFORME CONTIENE INFORMACIÓN MUY IMPORTANTE SOBRE SU AGUA POTABLE. TRADÚZCALO O HABLE CON ALGUIEN QUE LO ENTIENDA BIEN.

In accordance with the Environmental Protection Agency's reporting requirements, we are pleased to provide you with this year's Consumer Confidence Report for the Maidencreek Township Authority. We want to keep you informed about the excellent water and services we have delivered to you over the past year. Our goal is, and always has been, to provide to you a dependable supply of drinking water. Our water source is groundwater wells. The primary water sources are Well #3 located along Wesner Road and Well #5 located along Burgert Lane. Well #2 located on June Avenue is a supplemental water source. All of our sources are located within Maidencreek Township. **We're pleased to report that our drinking water meets federal and state requirements.**

If you have any questions or comments about this report or concerning your water utility, please contact Mr. Patrick Donovan at 610-926-4173. We want our valued customers to be informed about their water utility. If you want to learn more, please attend any of our regularly scheduled meetings. Meetings are held on the second Wednesday of every month at the Maidencreek Township Building located at One Quarry Road, Blandon.

The Maidencreek Township Authority routinely monitors for constituents in your drinking water according to Federal and State laws. The tables contained within this report shows the results of our monitoring for the period of January 1st to December 31st, 2007. All drinking water, including bottled drinking water, may be reasonably expected to contain at least small amounts of some constituents. It's important to remember that the presence of these constituents does not necessarily pose a health risk.

You will find many terms and abbreviations you might not be familiar with contained within the tables of this report. To help you better understand these terms; we've provided the following definitions:

Non-Detects (ND) - laboratory analysis indicates that the contaminant is not present at a detectable level.

Parts per million (ppm) or Milligrams per liter (mg/l) - one part per million corresponds to one minute in two years or a single penny in \$10,000.

Parts per billion (ppb) or Micrograms per liter - one part per billion corresponds to one minute in 2,000 years, or a single penny in \$10,000,000.

Action Level (AL) -the concentration of a contaminant, which, if exceeded, triggers treatment or other requirements which a water system must follow.

Treatment Technique (TT) - A treatment technique is a required process intended to reduce the level of a contaminant in drinking water.

Maximum Contaminant Level - The "Maximum Allowed" (MCL) is the highest level of a contaminant that is allowed in drinking water. MCL's are set as close to the MCLG's as feasible using the best available treatment technology.

Maximum Contaminant Level Goal - The "Goal"(MCLG) is the level of a contaminant in drinking water below which there is no known or expected risk to health. MCLG's allow for a margin of safety.

Picocuries Per Liter - Measure of radiation. (pCi/L)

Maximum Residual Disinfectant Level (MRDL) - The highest level of a disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control of microbial contaminants.

Maximum Residual Disinfectant Level Goal (MRDLG) - The level of a drinking water disinfectant below which there is no known or expected risk to health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contamination.

TEST RESULTS

Inorganic Contaminants

Contaminant (Unit of measurement)	Violation Y/N	Level Detected	Range	MCLG	MCL	Likely Source of Contamination
1. Nitrate as Nitrogen (ppm)	N	8.5	3.8-8.5	10	10	Run off from fertilizer use; leaching from septic tanks, sewage; erosion of natural deposits
2. Barium (ppm)	N	0.0294	0.0294 (e)	2	2	Discharge of drilling waste; discharge from metal refineries; erosion of natural deposits
3. Nickel (ppm)	N	.001 5/06	.001 (e)	.1	.1	Erosion of natural deposits
4. Chromium (ppm)	N	.0051	.0051 (e)	.1	.1	Erosion of natural deposits
5. Fluoride (ppm)	N	.140 5/06	.140 (e)	2* (d)	4	Water additive which promotes strong teeth.

Microbiological Contaminants

Contaminant (Unit of measurement)	Violation Y/N	Level Detected	Range	MCLG	MCL	Likely Source of Contamination
1. Total Coliform Bacteria (positive/negative)	N	5.0% (c)	0-5.0%	0	No more than 5% positive sample per month	Naturally present in the environment

Lead and Copper Contaminants

Contaminant (Unit of measurement)	Violation Y/N	Level Detected 90th Percentile Value	Units	MCLG	Action Level (AL)	# of Sites Above AL of Total Sites	Likely Source of Contamination
1. Lead (ppb)	N	6.4	ppb	0	15	0 out of 20 (a)	Corrosion of household plumbing.
2. Copper (ppb)	N	0.352	ppm	1.3	1.3	0 out of 20 (b)	Corrosion of household plumbing.

Footnotes:

- (a) 20 of 20 samples were less than the Action Level.
- (b) 20 of 20 samples were less than the Action Level.
- (c) Required check samples following positive results were all negative.
- (d) EPA's MCL for fluoride is 4 ppm. However, our state has set a lower MCL to better protect Human health.
- (e) Only one test taken during reporting period.

In 2005, to protect and extend the service life of the water storage tanks, the Authority painted both inside and outside of the tanks. Before the tanks were placed back into service, special tests were required by PA DEP to certify the water met acceptable drinking water standards. Total xylene was detected at 9.8 ppb and ethylbenzene was detected at 2.8 ppb. These test results were below the limits promulgated by PA DEP for drinking water.

The authority adds fluoride to its water supply for health benefits. The primary health benefit is the prevention of tooth decay. Fluoride is applied at a dosage rate of 0.75 to 1.0 part per million. The State determined this dosage rate to be the best for our climate.

The State allows us to monitor for some contaminants less than once per year because the concentrations of these contaminants do not change frequently. Some of our data, though representative, are more than one year old. Data on Nickel and Fluoride are more than one year old. The date, which corresponds with the data presented in the table, is located below the detected levels. What does this mean? As you can see by the table, our system had no violations. We're proud that your drinking water meets or exceeds all Federal and State requirements. We have learned through our monitoring and testing that some constituents have been detected. In addition to the Contaminants listed in the chart above, the Maiden Creek Township Authority routinely tests for bacteria.

All sources of drinking water are subject to potential contamination by constituents that are naturally occurring or man made. Those constituents can be microbes, organic or inorganic chemicals, or radioactive materials. All drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that the water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the Environmental Protection Agency's Safe Drinking Water Hotline at 1-800-426-4791.

A Source Water Assessment of the Authority's groundwater wells which serve as our community water supply was completed in 2003 by the PA Department of Environmental Protection (PA DEP). The Assessment has found that our groundwater supplies are most susceptible to transportation corridors (roads and railways), mulching and composting facilities, and industrial discharges. Overall, our water supply has a moderate risk of significant contamination. Final reports will be available at the Maiden Creek Township Authority office when final copies are received from PA DEP.

MCL's are set at very stringent levels for health effects. To understand the possible health effects described for many regulated constituents, a person would have to drink 2 liters of water every day at the MCL level for a lifetime to have a one-in-a-million chance of having the described health effect.

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. EPA/CDC guidelines on appropriate means to lessen the risk of infection by cryptosporidium and other microbiological contaminants are available from the Safe Drinking Water Hotline (800-426-4791).

Please call our office if you have questions. We at Maiden Creek Township Authority work around the clock to provide top quality water to every tap. We ask that all our customers help us protect our water sources, which are the heart of our community, our way of life and our children's future.

Disinfection Byproducts, Byproduct Precursors, and Disinfectant Residuals						
Contaminant (Unit of measurement)	Violation Y/N	Level Detected	Range	MCLG	MCL	Likely Source of Contamination
1. TTHMs (Total trihalomethanes) (ppb)	N	5.5	1.5-5.5	N/A	80	Byproduct of drinking water chlorination.
2. Haloacetic Acids (ppb)	N	0	0	N/A	60	Byproduct of drinking water chlorination.
3. Chlorine (ppm)	N	.61	0.28-0.61	MRDLG-4	MRDL-4	Water additive used to control microbes.
